

pKT Cabinet lock

The pKT electronic Cabinet lock has an integrated standard lever lock and ensures easy installation. The pKT Cabinet lock can be used in all cabinets and lockers with a door thickness of up to 20 mm. The electronics differentiate between locked and open status.

During the development of the pKT Cabinet lock, particular attention was paid to easy installation, handling and comprehensive application possibilities of the electronic Cabinet lock.

The door hinge can be set to the right or left, depending on requirements. An additional screw secures the lock in place. The battery compartment, which is accessible from the outside, can be opened with a special tool and the battery (conventional 3.6V AA lithium) can be replaced if necessary. This allows for up to 150,000 lockings (depending on the transponder technology used).

On the pKT Cabinet lock, transponders and ID cards with a pKT segment can be used as keys.

Features

- For left and right cabinet doors
- Existing holes can usually be used
- Free choice of lockers or fixed allocation of lockers possible
- 100 % Primion pKT compatible
- Individual and group authorisations possible
- Coupling time programmable
